13. ABSTRACT *(Maximum 200 words)*

The Water Quality Act of 1987, Section 118, authorizes the Great Lakes National Program Office (GLNPO) to carry out a 5-year study and demonstration project, Assessment and Remediation of Contaminated Sediment (ARCS), with emphasis on the removal of toxic pollutants from bottom sediments. Information from the ARCS program is to be used to guide the development of Remedial Action Plans (RAPs) for 42 identified Great Lakes Areas of Concern (AOCs) as well as Lake-wide Management Plans. The AOCs are areas where serious impairment of beneficial uses of water or biota (drinking, swimming, fishing, navigation, etc.) is known to exist, or where environmental quality criteria are exceeded to the point that such impairment is likely. Priority consideration was given to the following AOCs: Saginaw Bay, Michigan; Sheboygan Harbor, Wisconsin; Grand Calumet River, Indiana; Ashtabula River, Ohio; and Buffalo River, New York.

13. (Concluded).

The Environmental Laboratory of the US Army Engineer Waterways Experiment Station (WES) was asked to review existing data and information for each of the five priority AOCs. The approach used by WES was to bring together WES scientists who have been conducting research on the various aspects of contaminant mobility in the aquatic environment and develop a list of information required to evaluate the potential for contaminant mobility. A team of WES scientists then visited the RAP coordinator and associated staff for each AOC. Corps Districts responsible for the navigation projects in each AOC were also visited.

This report summarizes the information obtained for the Grand Calumet River. It is arranged for information retrieval by subject in a quick and easy manner (GLNPO Subject-Reference Matrix). Data and information from numerous reports have been included as figures and tables; wherever possible, the reference sources are identified.

SUMMARY

The Water Quality Act of 1987, Section 118, authorizes the Great Lakes National Program Office (GLNPO) to carry out a 5-year study and demonstration project, Assessment and Remediation of Contaminated Sediment (ARCS), with emphasis on the removal of toxic pollutants from bottom sediments. Information from the ARCS program is to be used to guide the development of Remedial Action Plans (RAPs) for 42 identified Great Lakes Areas of Concern (AOC) as well as Lake-wide Management Plans. The AOCs are areas where serious impairment of beneficial uses of water or biota (drinking, swimming, fishing, navigation, etc.) is known to exist, or where environmental quality criteria are exceeded to the point that such impairment is likely. Priority consideration was given to the following five AOCs: Saginaw Bay, Michigan; Sheboygan Harbor, Wisconsin; Grand Calumet River, Indiana; Ashtabula River, Ohio; and Buffalo River, New York.

The ARCS Program is to be completed during the period 1988-1992. The overall objectives of the ARCS program are to:

a. Assess the nature and extent of bottom sediment contamination at selected Great Lakes AOC.

b. Evaluate and demonstrate remedial options, including removal, immobilization, and advanced treatment technologies, as well as "no-action" alternatives.

c. Provide guidance on assessment and remedial action to the various levels of government in the United States and Canada in the implementation of RAPs for the areas of concern, as well as direction for future evaluations in other areas.

The Environmental Laboratory (EL) of the US Army Engineer Waterways Experiment Station (WES) was asked to review existing data and information for each of the five priority AOCs. The approach used by WES was to bring together WES scientists who have been conducting research on the various aspects of contaminant mobility in the aquatic environment and develop a list of information (Table 1) required to evaluate the potential for contaminant mobility. All contaminant migration pathways were considered and are shown in Figure 1. A team of WES scientists then visited the RAP coordinator and associated staff for each AOC. Corps Districts responsible for the navigation projects in each AOC were also visited. During these meetings, discussions centered around what information was available for each item on the list of information developed by WES. Sources of additional information were obtained from the discussions.

This report summarizes the information obtained for the Grand Calumet River Area of Concern. The report attempts to retrieve information by subject in a quick and easy manner (GLNPO Subject-Reference Matrix). Data and information from numerous reports have been included as figures and tables. Wherever possible, references are given for the included data and information.

PREFACE

The study reported herein was conducted by the US Army Engineer Waterways Experiment Station (WES) for the US Environmental Protection Agency (USEPA) Great Lakes National Program Office (GLNPO). The work was monitored by the US Army Engineer Division, North Central.

The report was prepared by Dr. J. W. Simmers, Research Biologist, Dr. C. R. Lee, Soil Scientist, Mr. D. L. Brandon, Statistician, Dr. H. E. Tatem, Aquatic Biologist, and Mr. J. G. Skogerboe, Physical Scientist, all of the Contaminant Mobility and Regulatory Criteria Group (CMRCG), Ecosystems Research and Simulation Division (ERSD), Environmental Laboratory (EL), WES.

Generous cooperation and assistance in locating existing data and information were provided by Messrs. Jan Miller and John Dorkin of the US Army Engineer District, Chicago, and Messrs. John Winter and Brad Rutledge of the State of Indiana Department of Environmental Management. Mr. Winter was also the Coordinator of the Remedial Action Plan. Mr. Larry Bird, ERSD, provided technical assistance in the preparation of tabulated data and the manuscript for publication.

The work was conducted under the supervision of Dr. L. H. Saunders, Chief, CMRCG; Mr. D. L. Robey, Chief, ERSD; and Dr. John Harrison, Chief, EL. General supervision was provided by Mr. D. Cowgill, NCD, and Mr. T. Kizlauskas, USEPA GLNPO, initially, and later by Mr. J. Miller, NCD, and Mr. D. Cowgill, USEPA GLNPO.

Commander and Director of WES was COL Larry B. Fulton, EN. Technical Director was Dr. Robert W. Whalin.

This report should be cited as follows:

INFORMATION SUMMARY AREA OF CONCERN: GRAND CALUMET RIVER, INDIANA

INTRODUCTION

Background

The Water Quality Act of 1987, Section 118, authorizes the Great Lakes National Program Office (GLNPO) to carry out a 5-year study and demonstration project, Assessment and Remediation of Contaminated Sediment (ARCS), with emphasis on the removal of toxic pollutants from bottom sediments. Information from the ARCS program is to be used to guide the development of Remedial Action Plans (RAPs) for 42 identified Great Lakes Areas of Concern (AOC) as well as Lake-wide Management Plans (Figure 2).

The AOCs are areas where serious impairment of beneficial uses of water or biota (drinking, swimming, fishing, navigation, etc.) is known to exist, or where environmental quality criteria are exceeded to the point that such impairment is likely. Priority consideration was given to the following five AOCS: Saginaw Bay, Michigan; Sheboygan Harbor, Wisconsin; Grand Calumet River, Indiana; Ashtabula River, Ohio; and Buffalo River, New York.

Each state has established RAP coordinators to develop a RAP for each AOC. Most RAP coordinators state that there is a need to develop guidance to interpret the information in a manner that will allow decisions to be made about each AOC. The following summarizes the status of the RAP Reports for the five priority AOCs:

Area of Concern	Status
Saginaw Bay	Final RAP - September 1988
Grand Calumet River	Draft RAP - January 1988
Sheboygan Harbor	Draft RAP - December 1988
Buffalo River	Final RAP - November 1989
Ashtabula River	Draft RAP - September 1989

Purpose

The purpose of this report is to summarize the information collected during meetings with RAP Coordinators and Corps Districts to find out what information was available on contaminant migration at each of the five priority AOCs.

Scope

Information collected during visits to RAP Coordinators and Corps Districts is summarized. Sources of additional information have been referenced so that these sources could be contacted at a later date. Documents that were mentioned during meetings with RAP coordinators, but were not available at that time, are referenced so that these documents can be obtained, if desired. Retrieval of information by subject in a quick and easy manner was a goal of this report.

MSD	Metropolitan Sanitary District (Chicago)

SUMMARY OF INFORMATION

Boundary of AOC

The general location of the Grand Calumet River (GCR) AOC is shown in Figure 3, and the boundary is shown in Figure 4. The AOC includes most of the

Grand Calumet River (GCR), the Indiana Harbor and Canal (IHC), and nearshore Lake Michigan. The AOC is located in Lake County, Indiana. The drainage basin composing the Grand Calumet-Indiana Harbor Canal (GCR-IHC) AOC includes approximately 43,000 acres (67 square miles).*

Contaminants of concern

At least 33 studies have been conducted which monitored water, sediment, or biota in the nearshore Lake Michigan portion of the Grand Calumet AOC (Table 2); 10 studies have been concerned with only the GCR-IHC sediments (Table 3). Data from these studies have been collected, and the Contaminants of Concern have been tabulated according to water sediment or biota in the AOC. Contaminants in the GCR-IHC AOC include a mix of metals and organic compounds including PCBs, PAHs, phenol, and cyanide. Fish consumption advisories for Lake Michigan have been promulgated by the states of Indiana, Illinois, Michigan, and Wisconsin as well as the USEPA Great Lakes National Program Office and the USFDA. The 1987 Lake Michigan Advisory suggested the following for Indiana Waters:

> Brown trout over 23 inches, lake trout over 23 inches, Chinook over 32 inches, catfish and carp should not be eaten. Chinook salmon over 21 to 32 inches, lake trout between 20 to 23 inches, Coho salmon over 26 inches, and brown trout up to 23 inches should not be eaten by children age 15 or under, pregnant women, women who may become pregnant, or nursing mothers. All others should limit their consumption to one meal (0.23 kg) per week.

A fish consumption advisory was issued in 1985 which included the GCR/IHC system. No fish from these waters should be eaten.

Other impairments have been beach closings due to high coliform counts, aesthetic impact of crude oil on nearshore beaches, and the poor quality of biological habitats.

Levels of contaminants

The highest concentrations of contaminants found in the Grand Calumet River AOC sediments are listed in Table 4. Ranges of water quality parameters are shown in Table 5.

Volume of contaminated sediments

The Draft IDEM RAP (R15)** has summarized the estimates of the volume of soft, contaminated bottom sediments obtained by the USACOE and USEPA V. These

---

* A table of factors for converting non-SI units of measurement to SI (metric) units is presented on page 11.

** See References list at the conclusion of the main text.

estimates are 1.4 million cu yd in the east branch of the Grand Calumet, and 700,000 cu yd in the west branch and IHC upstream of the navigation project. The authorized navigation project contains 1,000,000 cu yd, and the Chicago District USACOE has estimated between 500,000 and 1 million cu yd of soft sediments adjacent to the authorized channel. Altogether, there are approximately 3.5 to 4 million cu yd of contaminated sediments within the AOC.

Sediment data

There have been at least 10 major sediment sampling studies on the GCR/IHC conducted by the USEPA V, the IDEM, and the USACOE. These studies have often included elutriate tests, modeling, and evaluations related to dredged material and disposal. The specific locations of the sampling sites and representative sediment contaminant data are shown in Figures 5-15 and Tables 6-28.

Water quality data

The IDEM, USACOE, MSD, and USEPA V have collected water quality data from the GCR-IHC and nearshore Lake Michigan. The IDEM has maintained a fixed station water quality surveillance program for several years in conjunction with the activities to monitor industrial and municipal wastewater discharges. Collection locations and typical data from the water quality assessments, including groundwater, are shown in Figures 16-26 and Tables 29-35.

Point source discharges

The Grand Calumet is predominantly fed by municipal and industrial waste water (up to 90 percent of the flow). The NPDES permits and extensive monitoring of outflows have produced an extensive body of data. Representative water quality monitoring data from industrial and municipal point sources, and the results and locations of monitoring stations and inflows are provided in Figures 27-30 and Tables 36-45. Improvement in POTW by municipal treatment facilities is shown in Table 46.

Nonpoint source discharges

Studies have been performed by the USEPA on the combined sewer overflow (CSO) loadings to the CG/IHC. In addition, as part of the analysis for a draft EIS on maintenance dredging and disposal, the Chicago District USACOE estimated the annual loadings of sediments to the GCR/IHC from point and non-point sources. These data are shown in Tables 47-49. The IDEM data have indicated that groundwater in the AOC is contaminated (Figure 25).

Waterway hydraulics/watershed hydrology

The drainage basin of the Grand Calumet is shown in Figure 31. Stream flow directions are shown in Figure 32. Flow data for IHC and the Grand Calumet River are summarized in Tables 50-54 and Figures 20 and 31-33. The sites evaluated in the USGS inflow investigation, as shown on USGS topographic sheets, are illustrated in Figure 34.

Air quality

Air quality data have been collected by IDEM. The air quality of Lake County was monitored for suspended particulates, sulfur dioxide, volatile organic compounds, nitrogen oxides, and carbon monoxide. The sources of the contaminants and percentage originating at each source have been identified. These data are summarized in Figures 35-37.

Potential hazardous
waste sites/Superfund sites

Fifty sites have been identified and listed (Table 55), which are a mixture of NPL, RCRA, and CERCLA. There are 38 waste fills or lagoons in the AOC (Table 56). Of these sites, 11 have been considered to have highest priority (Table 57). The site locations of major landfills and national priority list sites are shown in Figure 38.

Spills

The IDEM has documented the spills that have occurred in Lake County and in the vicinity of the AOC. In 1986 there were 60 spills in Lake County. Locations and sources of spills are presented in Figures 39-42.

Adjacent land use contaminant sources

Adjacent land uses are predominantly industrial in nature. This has been extensively documented by the IDEM, USACOE, USGS, and USEPA. The adjacent land uses have previously been indicated in Tables 36-45 and Figures 20, 27-30, 34, and 40 in relation to point and nonpoint source discharges. Additional information on adjacent land use is shown in Figures 43-45 and Tables 55-57. There are 180 hazardous waste facilities in Lake County. A small portion of the land is still devoted to parks and natural areas (Figure 46).

Bioassay data

The contaminant mobility from sediment in the GCR/IHC area has been the subject of numerous bioassays or bioassessments. Many of the bioassays were conducted to evaluate the suitability of the sediment in the Federally authorized channel for various disposal alternatives. Other series of bioassays

were conducted to evaluate the toxic and chronic effects of municipal and industrial outfalls. Only biological assessments conducted with laboratory organisms under controlled conditions will be tabulated under this topic heading; field-oriented studies appear under "Biological Data." Typical Extraction Procedure-toxicity test results are shown in Table 58. Embryo-larval teratogenicity-toxicity test results on outfall effluents are shown in Tables 59 and 60. Predictions of total bioaccumulation potential based on animal lipid concentrations and sediment TOC are shown in Table 61. The results of bioassay procedures applied to evaluate the suitability of sediments from the Federal channel for upland disposal are shown in Tables 62-66.

Biological data

The natural areas that occur within the GCR-IHC AOC are illustrated in Figure 47. The dune and swale ecosystems identified and inventoried by the Lake Michigan Federation and the Coastal Zone Management Program are relatively unique remnants of once extensive dune areas.

Field biological assessments have taken two forms: assessments of the presence of fish and wildlife (including endangered species), and collection of organisms for chemical analysis or other evaluations related to the presence of contaminants. Electrofishing, crayfish trapping, plankton/periphyton collection, and protozoan colonization and photosynthetic/respiration response tests were conducted on in-place sediments. The results are presented in Tables 67-77 and Figures 47-49. Aquatic (including benthic) macroinvertebrates were also collected. Biomass, diversity, and population density are shown in Tables 78-81. Lists of aquatic species present are provided as Tables 82-85. Fishery advisories are in effect throughout the AOC, as previously noted. In the GCR-IHC, the advisories pertain to recreational fishing, since there has never been a fishery of commercial proportions.

Typical wildlife (exclusive of avifauna) are listed in Table 86; dominant vegetation components are listed in Table 87. The dense cattail marshes bordering portions of the GCR-IHC may be important as wildlife cover. The remnants of the dune and swale ecosystem in the GCR-IHC are the locations of unique plant and animal communities. Rare animals include the glass lizard, Franklin's ground squirrel, Blanding's turtle, and the Federally endangered Indiana bat. Five plant species characteristic of the dune and swale areas are candidates for Federal endangered listings. Bird life of the AOC includes numerous State threatened and endangered species, including the black tern and the American bittern.

Risk assessment

There are no risk assessment data other than the fish consumption advisory and the beach closings previously mentioned. The risk to the human population is implied by the water quality data summarized in Table 5 and the percentage of the monitoring stations where water quality standards were exceeded (Table 33).

Table 1. List of Information and Data Required to Evaluate In-Place Contaminated Sediments

1. SEDIMENT DATA

Water Content	OG
Hydrous Oxides (manganese, ferrous)	EC
Total PAHs	Redox
Total PCBs (aroclors and congeners)	Sulfides
TOC	SOD
Total Solids	Volatile Solids
OM	Salinity
EP Test	NH3

CEC (plus calcium, magnesium phosphorus, potassium concentration in extractant)
Atterberg Limits
Specific Gravity Determination
Dispersion Coefficients
Sediment Particle Density
Bulk Density
Permeability
Particle Size Distribution (hydrometer method); (include sand, fine sand, silt and clay)
Wet Sediment PH (1:2 sediment to distilled water solution)
Dry Sediment PH (1:2 sediment to distilled water solution)
% Base Saturation
% Free Calcium Carbonate
Potential PH or lime requirement using titration or similar method
Total Carbon Content
Total Soluble Heavy Metal Content
Total Heavy Metal Content
Surface Runoff Suspended Solids
Wet Sediment Extractable Heavy Metal Content (DTPA preferred)
Dry Sediment Extractable Heavy Metal Content (DTPA preferred)
Depth (thickness) of Mixed Top Sediment Layer
Depth (thickness) of Contaminated Sediment Layers
Sedimentation Rate (possibly through core dating)
Sediment Deposition History
Suspended Solids Settling Rates (possibly through sediment traps)
Consolidation Characteristics
Sediment Porosity (mixed layer and deeper layers)
Pesticides
Priority Pollutants (40 CFR Part 136)
Dioxin
Reference Site

2. WATER QUALITY DATA

DOC	TOC
DO	Hardness
BOD	PH
Metals	Conductivity

(Continued)

(Sheet 1 of 3)

Table 1 (Continued)

PAHs Temperature
PCBs Total Solids
Total Suspended Solids (distributed in time and space)
Best Estimates of Partition Coefficients for Low (water column) and High (bottom sediments) Sediment Concentrations
Sediment-Water Contaminant Distribution Coefficients
Bacteriological Quality
Priority Pollutants
Interstitial Water Contaminant Concentration

3. WATERWAY HYDRAULICS & FLOW
   Hydrology or Flows Through the System
   Area of Bottom Contamination
   Water Depth at Area of Contamination
   Contaminant Waste Loads to System
   Floods

4. POINT DISCHARGES INTO WATERWAY
   Contaminant Loads Based on Concentration and Volumetric Flow Rates
   Nonpoint Discharge
   Combined Sewer Overflow

5. NONPOINT DISCHARGES INTO WATERWAY
   Storm-Induced Surface Runoff
   Groundwater: Information on Geohydrology and Groundwater Characteristics
   Atmospheric Deposition

6. WATERSHED HYDROLOGY

7. MISCELLANEOUS INFORMATION
   Climatological Data
   Air quality

8. CONTAMINATED SITES
   Hazardous waste
   Superfund
   Spill

9. LAND USE OF ADJACENT PROPERTIES

10. BIOASSAY TEST DATA
   Rapid:
      Microtox
      Daphnia
      Ceriodaphnia
      Pontoporeia
      Ames Test

(Continued)

(Sheet 2 of 3)

Table 1 (Concluded)

- Chronic:
    - *C. tentans*
    - *Daphnia*
    - Fathead minnows
    - Macroinvertebrate
- Plant bioassay data:
    - Total PCB Content (aroclor content)
    - Specific PCB Congeners
    - PAHs
    - Heavy Metal Uptake

11. BIOLOGICAL DATA
    - Fisheries surveys, including:
        - body weight/size
        - diet/stomach contents
        - feeding type
        - lipid content
        - phytoplankton
        - zooplankton
        - birds
        - mammals
        - federal
        - state
    - Benthic Community
        - overall benthic "health"
        - benthic indicators/low diversity
        - plants

12. RISK ASSESSMENT
    - Human Health
    - Ecological

12	0.09	0.006	0.[illegible]	0.05
13	nd	nd	nd	nd

* Hypothetical maximum whole organism concentration of PCBs in organism with lipid content of 2 percent.

** Locations are the same as those used in US Army Engineer District, Chicago (1979).

† PCB concentration in overlying water is 0.8 × 10^{-5} mg/ℓ.

†† nd = less than detection level (e.g. <0.02 ppm).

Table 25. Comparative Chemical Composition of Indiana Harbor and Lake Michigan Sediments (Source R24, Table 2)

Parameter	Concentration in Sediment, mg/kg dry weight: Indiana Harbor	Lake Michigan
Metals		
Arsenic	29.5	10.1
Cadmium	20.0	0.1
Chromium	650.0	4.4
Lead	879.0	11.9
Mercury	0.5	BD*
Zinc	4,125.0	54.1
Pesticides		
Aldrin	2.55	0.0006
Polyaromatic hydrocarbons		
Acenaphthene	96	BD
Acenaphthylene	22	BD
Anthracene	62	BD
Benzo(a)anthracene	86	BD
Benzo(b)fluoranthene	140	BD
Benzo(a)pyrene	87	BD
Benzo(g h i)perylene	35	BD
Chrysene	92	BD
Fluoranthene	150	BD
Fluorene	69	BD
Indeno(1,2,3-c d)pyrene	50	BD
Naphthalene	2,000	0.46
Phenanthrene	200	BD
Pyrene	140	BD
Polychlorinated biphenyls		
PCB-1248	33.4	BD
PCB-1254	BD	0.013
Total organic carbon	7.39% of sediment weight	1.83% of sediment weight
Total inorganic carbon	2.28% of sediment weight	0.47% of sediment weight
Oil and grease	3.88% of sediment weight	1.71% of sediment weight
Phenol	3	BD

* BD = below detection.

Table 26. Analysis of Sediment Samples from Chicago River and Harbor and Calumet River and Harbor Collected April 27-28, 1981 (Source R9, Table 1)

LOCATION	Moisture (%)	CN	AS	BA	CD	CR	PB	AG	HG
CALUMET HARBOR 2A - near N. break-wall	52.7	.48	21	168	17	117	255	<5	<.1
CALUMET HARBOR IN - N. line of CDF, 500' E of PL	40.5	.5	18	53	16	133	276	<5	<.1
CALUMET HARBOR 2E - E. line of CDF on fence line	42.4	.19	23	112	13	133	242	<5	<.1
CALUMET RIVER 5 - Division bwtn. Harbor/River	45.1	1.16	18	185	23	152	393	<5	<.1
CALUMET RIVER 10 - 106th St.	33.2	1.72	24	99	28	88	400	<5	.2
CALUMET RIVER 13 - Turning Basin #3	33.9	1.44	46	64	<5	136	656	<5	.2
CHICAGO HARBOR 15 - outer Harbor	50.4	<.13	33	91	18	155	254	<5	<.1
CHICAGO HARBOR 14 - Inner Harbor	32.4	<.13	29	57	<5	72	222	<5	.3
CHICAGO RIVER 12 - Lake Shore Drive	51.3	.27	30	56	31	101	457	<5	<.1
CHICAGO RIVER 10 - N. Clark St.	37.7	.17	14	106	40	114	473	128	<.1

All units expressed as mg/kg dry weight except as noted otherwise.

Table 27. Polution Classification of Sediments Collected from Chicago River Harbor and Calumet River and Harbor (Source R9, Table 2)

Classification	Cn	As	Ba	Cd	Cr	Pb	Hg
Non-polluted	- 2/	0	0	2	0	0	10
Moderately polluted	2	0	3	-	1	0	-
Heavily polluted 1/	6	10	7	8	9	10	0

Ten samples analyzed.

1/ Cadmium and Mercury is classified as polluted or not with no intermediate classification.
2/ Classified as non-polluted: below detection limit which is above non-polluted concentration. Therefore two samples cannot be classified for Cn.

Table 28. Elutriate Analysis of Sediment Samples from Calumet River and Harbor (Source R9, Table 3)

LOCATION	SAMPLE	CN	AS	BA	CD	CR	PB	AG	HG
CALUMET HARBOR	Elutriate	<20	<1	52.7	<1	<1	<2	<.1	<1
2A - near N. breakwall	Water	<20	<1	22.1	<1	<1	<2	<.1	<1
CALUMET HARBOR	Elutriate	<20	12	77.9	<1	<1	<2	<.1	<1
IN - N. line of CDF, 500' E. of PL	Water	<20	<1	21	<1	<1	<2	<.1	<1
CALUMET HARBOR	Elutriate	<20	3	76	<1	6	<2	<.1	<1
2E - E. line of CDF on fence line	Water	<20	<1	21.6	<1	<1	<2	<.1	<1
CALUMET RIVER	Elutriate	<20	2	44.9	<1	<1	<2	<.1	<1
5 - division between Harbor/River	Water	<20	1	22.7	<1	<1	<2	<.1	<1
CALUMET RIVER	Elutriate	<20	2	67.2	<1	<1	<2	<.1	<1
10 - 106th St.	Warer	<20	<1	24	<1	<1	<2	<.1	<1
CALUMET RIVER	Elutriate	<20	3	66.8	<1	12	<2	<.1	<1
13 - Turning basin #3	Water	<20	<1	28.5	<1	<1	<2	<.1	<1

All units expressed as μg/liter

[a]Will discharge to proposed sanitary sewer system.
[b]Increased flows due to anticipated improvements within area.
[c]The projected population increase of 8,935 persons for Gary assumed not to change run-off quantities.
[d]Increased flows due to multi-family housing developments with resultant increased run-off.

Table 54. 1986-87 Water Year Data, Little Calumet River
(Source R37, Page 201)

LOCATION.--Lat 41°34'19", long 87°19'13", in NE¼SE¼ sec.15, T.36 N., R.8 W., Lake County, Hydrologic Unit 04040001, on right bank 100 ft upstream of Pennsylvania Railroad bridge, 800 ft upstream of Martin Luther King Avenue bridge at Gary, 1.3 mi downstream of highway 53, and 1.5 mi upstream from confluence with Deep River.

DRAINAGE AREA.--5.8 mi^2, approximately.

PERIOD OF RECORD.--June 1958 to September 1967, October 1968 to September 30, 1971 (discharge), December 13, 1984 to current year (gage heights only).

GAGE.--Water-stage recorder. Wooden control since Dec. 13, 1984. Datum of gage is 580.00 ft above National Geodetic Vertical Datum of 1929.

REMARKS.--Stage affected by backwater from Deep River during times of flood. Minimum gage height for the period of record may have been lower prior to December 13, 1984.

EXTREMES FOR PERIOD OF RECORD.--Maximum gage height, 11.59 ft, Nov. 21, 1985; minimum gage height, 5.74 ft, Sept. 10, 15-19, 1986. Minimum gage height not reported prior to December 13, 1984.

EXTREMES OUTSIDE PERIOD OF RECORD.-- Flood in October 1954 reached a stage of 13.09 ft, from flood mark.

EXTREMES FOR CURRENT YEAR.--Maximum gage height, 9.83 ft, June 3; minimum gage height, 5.86 ft, Aug. 13.

* Mean of three replicates +/- standard deviation expressed as μg/g (=ppm) dry weight. Means in a row followed by the same letter are not significantly different according to Duncan's New Multiple Range procedure at alpha = 0.05.

** 6-month aging.

Time = 0.

Time = 28 days.

The analysis of variance indicated that uptake could be considered marginally significant:probability > F = 0.0754.

Expressed as Aroclor 1248 in the original sediment only.

Table 66. PAH Concentrations in Indiana Harbor Sediments and Earthworms (Source R25, Table D9)

PAH	Original Sediment	Aged** Sediment	Initial Earthworms	Bioassay Earthworms
Naphthalene	2033.333 +/- 57.735a	46.267 +/- 1.258b	d	d
Acenaphthylene	21.667 +/- .577	d	d	d
Acenaphthene	105.333 +/- 8.083	d	d	d
Fluorene	78.333 +/- 8.145a	4.287 +/- 0.731b	d	d
Phenanthrene	206.667 +/- 11.547a	14.267 +/- 3.650b	d	d
Anthracene	63.333 +/- 1.528a	74.033 +/- 6.269b	d	35.264 +/- 16.37
Fluoranthene	160.000 +/- 10.000a	36.933 +/- 5.659b	d	d
Pyrene	143.333 +/- 5.774a	74.033 +/- 6.269b	d	35.264 +/- 16.37
Chrysene	95.667 +/- 4.041a	25.500 +/- 5.724b	d	12.218 +/- 5.92
Benzo(a)anthracene	102.000 +/- 13.856a	21.633 +/- 2.363b	d	d
Benzo( )fluoranthene	156.667 +/- 15.275a	41.700 +/- 19.213b	d	20.915 +/- 10.49
Benzo(a)pyrene	105.667 +/- 16.921a	33.900 +/- 10.789b	d	18.420 +/- 5.90
Indeno(1,2,3-c,d)pyrene	57.000 +/- 10.440a	18.513 +/- 12.491b	d	9.295 +/- 2.78
Dibenzo(a,h)anthracene	13.667 +/- 6.351a	d	d	d
Benzo(g,h,i)perylene	39.667 +/- 4.163a	4.280 +/- 7.703b	d	4.497 +/- 0.74
Total PAH	3382.333 +/- 142.388a	388.217 +/- 80.765b		131.430 +/- 11.17

Note: d = detection limit.

* Means of three replicates +/- standard deviation expressed as µg/g (=ppm) dry weight. Means in a row followed by the same letter are not significantly different according to Duncan's New Multiple Range procedure at alpha = 0.05.

** 6-month aging.

Time = 0.

Time = 28 days.

Benzo(b)fluoranthene + Benzo(k)fluoranthene.

Table 67. Summary of Electrofishing Catch from Station F in the Indiana Harbor Canal, 2 Dec 84 (Source R39, Table 2)

Fish Species Collected	Number of Fish	Total Weight of Fish (g)	Catch Per 30 Minutes		Catch Per 400 Meters		Percent of Total Catch	
			Number of Fish	Weight of Fish (g)	Number of Fish	Weight of Fish (g)	Number of Fish	Weight of Fish (g)
Alewife	1	4.61	0.34	1.55	0.50	2.31	0.45	0.05
Gizzard shad	72	500.62	24.13	167.81	36.00	250.31	32.58	4.98
Central mudminnow	1	1.08	0.34	0.36	0.50	0.54	0.45	0.01
Goldfish	26	180.20	8.72	60.40	13.00	90.10	11.76	1.79
Carp	7	8,859.92	2.35	2,969.81	3.50	4,429.96	3.17	88.18
Fathead minnow	22	19.56	7.37	6.56	11.00	9.78	9.95	0.19
Pumpkinseed	28	329.28	9.39	110.37	14.00	164.64	12.67	3.28
Yellow perch	64	151.76	21.45	50.87	32.00	75.88	28.96	1.51
TOTALS	221	10,047.03	74.09	3,367.73	110.50	5,023.52		

* Total electrofishing time and distance, 89 minutes, 30 seconds, and 800 meters, respectively.

Table 83. Phytoplankton Identified from Indiana Harbor and Canal (Source R1, Appendix 1)

Area	Dominant taxa (in order of relative abundance)	Comments
Q (small sample)	*Fragilaria crotonensis* *Tabellaria fenestrata* *Synedra ulna* *Asterionella formosa* *Melosira varians/Spirulina* (?) sp.	Diatoms were very abundant. The sample was dominated by smaller taxa and was not very diverse.
R (small sample)	*Tabellaria fenestrata* *Asterionella formosa* *Fragilaria crotonensis* *Synedra ulna* *Melosira varians*	Sample was dominated by filamentous/colonial diatoms and was not very diverse.
T (large sample)	*Tabellaria fenestrata* *Fragilaria crotonensis* *Synedra ulna* *Asterionella formosa* *Oscillatoria* sp.	The sample was numerically dominated by diatoms. Several different algalgroups were observed, making the sample relatively diverse.

Table 84. Periphyton Identified from Indiana Harbor and Canal (Source R1, Appendix 2)

Area	Dominant taxa (in order of relative dominance)	Comments
R (begin.)	*Oscillatoria/Lyngbya* sp. *Tabellaria fenestrata* *Synedra ulna* *Achnanthes* sp. *Melosira* sp.	Sample was not very diverse.
R (end)	*Cladophora* sp. (*glomerata*) *Rhoicosphenia curvata* *Achnanthes* sp. *Synedra ulna* *Lyngbya* sp./*Oscillatoria* sp.	*Cladophora* was the most abundant filamentous alga and most American forms are assigned to the species *glomerata*. Sample was also dominated by diatoms.

Dorosoma cepedianum	Gizzard shad	x	x	x
Umbra limi	Central mudminnow	x	x	
Carassius auratus	Goldfish	x	x	x
Cyprinus carpio	Carp	x	x	x
C. auratus x *C. carpio*	hybrid	x	x	
Notemigonus crysoleucas	Golden shiner	x	x	x
Notropis atherinoides	Emerald shiner	x	x	x
Notropis hudsonius	Spottail shiner	x	x	
Pimephales notatus	Bluntnose minnow	x	x	
Pimephales promelas	Fathead minnow	x	x	
Lepomis gibbosus	Pumpkinseed	x	x	
Lepomis macrochirus	Bluegill	x	x	
Pomoxis nigromaculatus	Black crappie	x	x	
Perca flavescens	Yellow perch	x	x	x
Salmo gairdneri	Rainbow trout		x	
Salmo trutta	Brown trout		x	
Salvenlinus namaycush	Lake trout		x	
Oncorhynchus tsawytscha	Chinook salmon		x	
Osmerus mordax	Rainbow smelt		x	
Catostomus commersoni	White sucker		x	
Ambloplites rupestris	Rock bass		x	
Lepomis cyanellus	Green sunfish		x	
Micropterus dolomieui	Small mouth bass			
Etheostoma nigrum	Johnny darter			x
Cottus bairdi	Mottled sculpin			x
Lepomis (Hybrid)	Sunfish (Bluegill x Pumpkinseed?)			x

VERTEBRATE WILDLIFE *OBSERVED DURING
GRAND CALUMET RIVER FIELD TRIP (June 24-27,'86)

	<5	5 - 15	>15
FISH			
Carp			X
Golden Shiner			X
Goldfish			X
Redear Sunfish	(1)		
REPTILES			
Painted Turtle	X		
AMPHIBIANS			
(None)			
MAMMALS			
Muskrat		X (many dens were observed)	

*Birds are in separate list

Table 87. Preliminary List of Vegetation in the Grand Calumet River Area (Source R38)

Dominant Vegetation	
Cattail	*Typha domingensis* (Typhaceae)
Reed Grass	*Phragmites cummunis* (Gramineae)
Water Plantain	*Sagittaris* sp. (Alismaceae)
Lemna sp. (duckweed) in stagnant marsh areas and coves.	
Occasionals	
Pondweed	*Potamogeton* sp. (Najadaceae)
Water milfoil	*Myriophyllum* sp. (Haloragidaceae)

STATIONS WHERE THE PARAMETER WAS TESTED

Monthly Stations:
= No violations of State standards in five years.
= Violation in five years.

Quarterly Stations:
= No violations in five years.
= Violations in five years.

C = CORE Stations

Notes

P= Process wastewater, treated process wastewaters, and/or contact cooling waters

C= Non-contact cooling waters, and/or stormwater runoff

P/C=Outfall discharges both types of waters

M.D.= Minor discharge

MGD= Million gallons per day

tgd= thousand gallons per day
